Do year−to−year changes in disturbance track year−to−year changes in EFPs?

tc>=30 (93 sites), consecutive−year pairs only (YEAR_t − YEAR_(t−1) = 1) | Delta = value(t) − value(t−1), pooled across sites
linear fit with 95% CI | Spearman rho, BH−FDR across the 4 EFPs

Simple pairwise complement to the SHAP−based results (Miguel, FORTRACK 2026−09−14), not a replacement.
Caveat (Teja, same meeting): a same−year climate swing could drive both axes at once − this raw test does not control for that.
