IGBP board ... C+T+M | 24m window | LGB | tree cover ...30 % (104 sites, deadtrees v4.1)

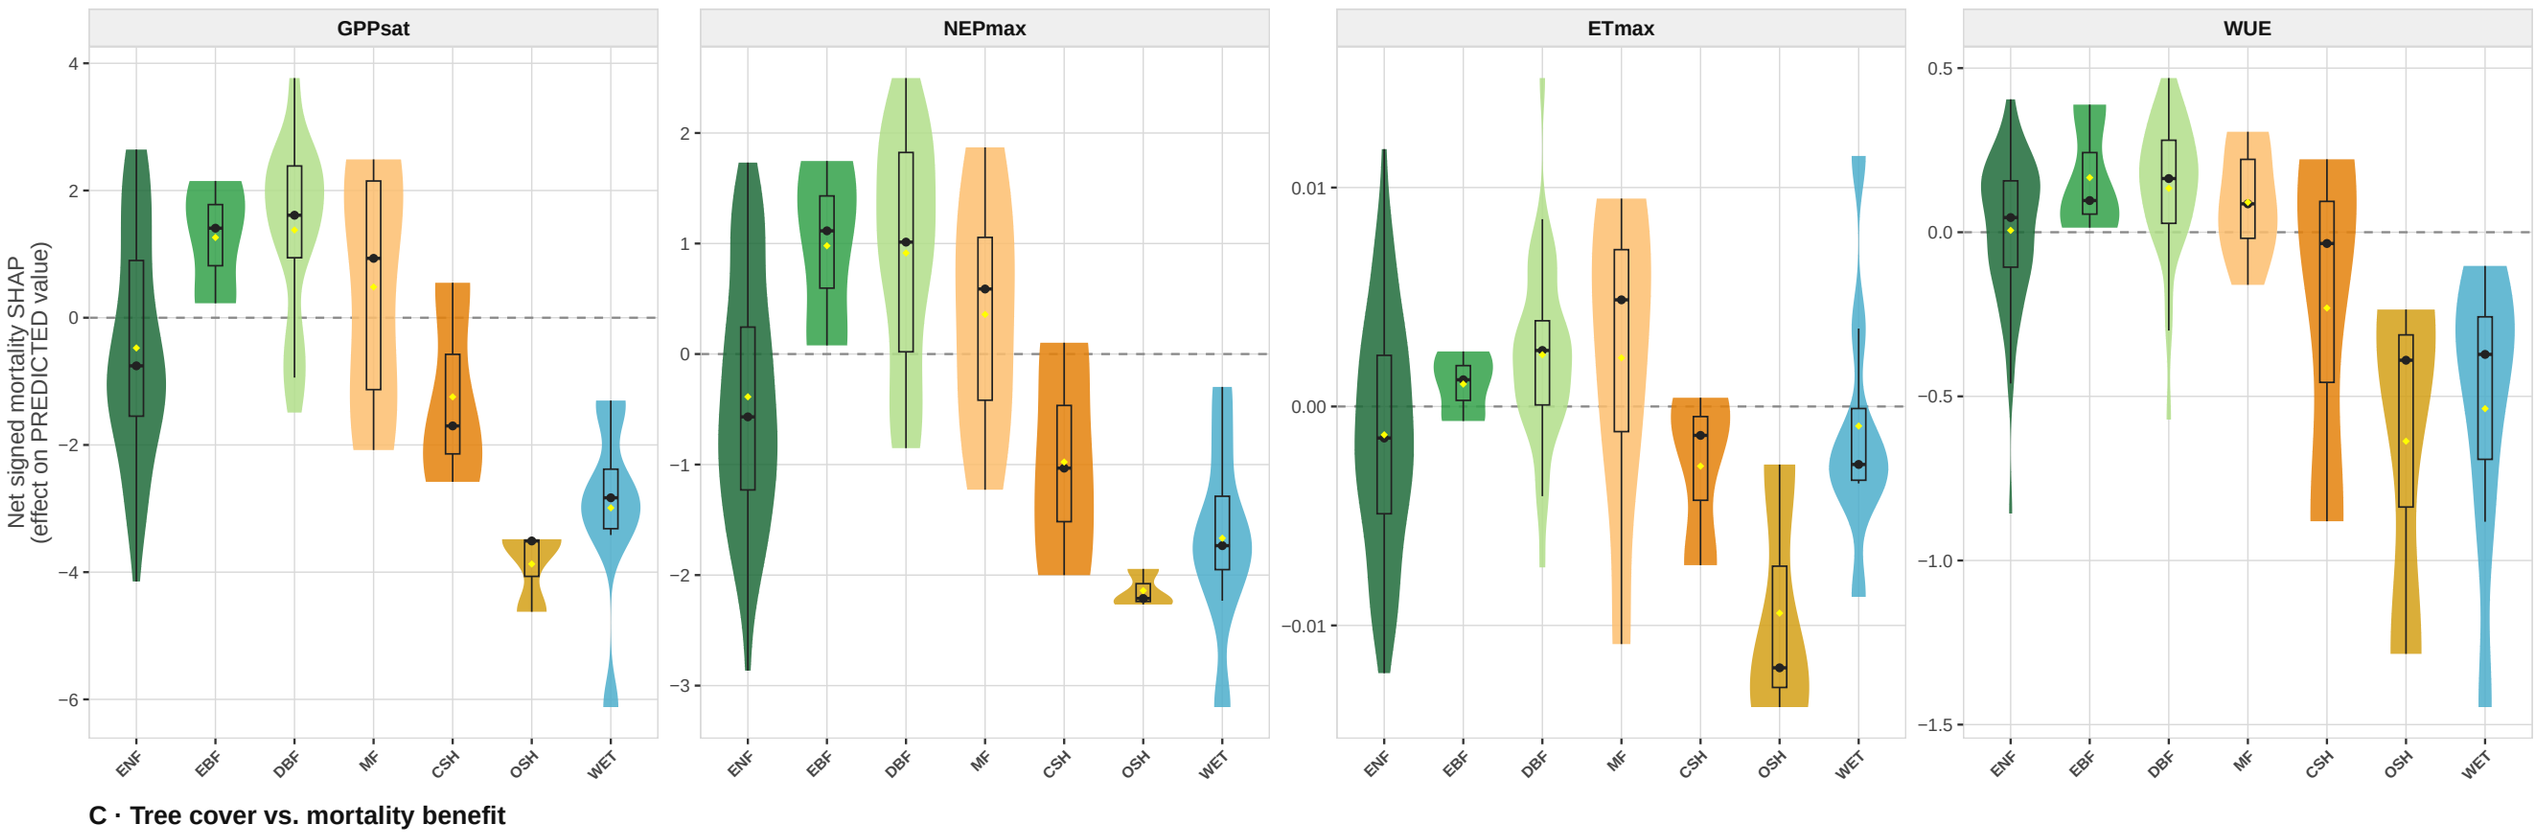

A · ..RMSE by IGBP class

White dot = median | Yellow diamond = mean | negative = D improved

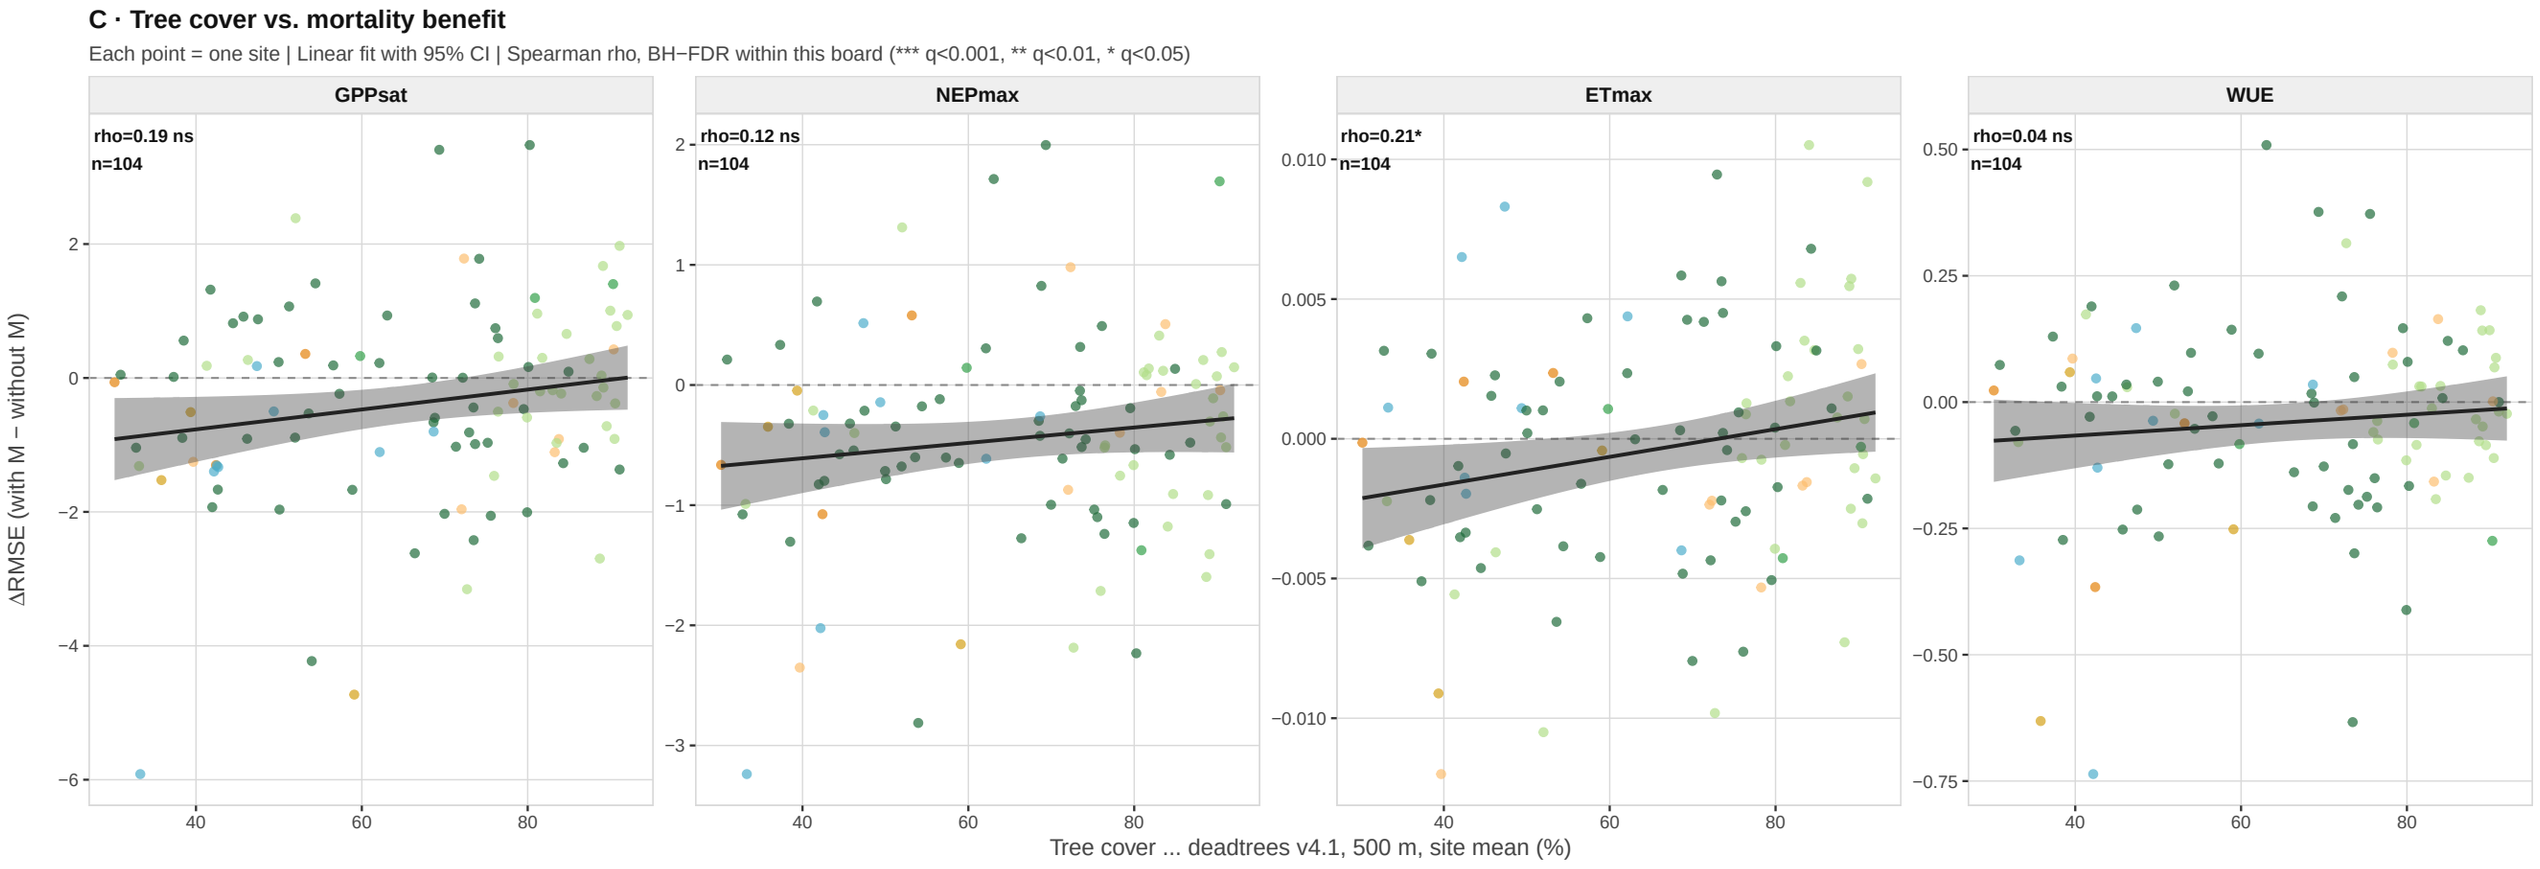

B · Direction of the mortality effect by IGBP class

Net signed SHAP of the mortality block | below zero = model predicts a LOWER EFP value (not worse accuracy)

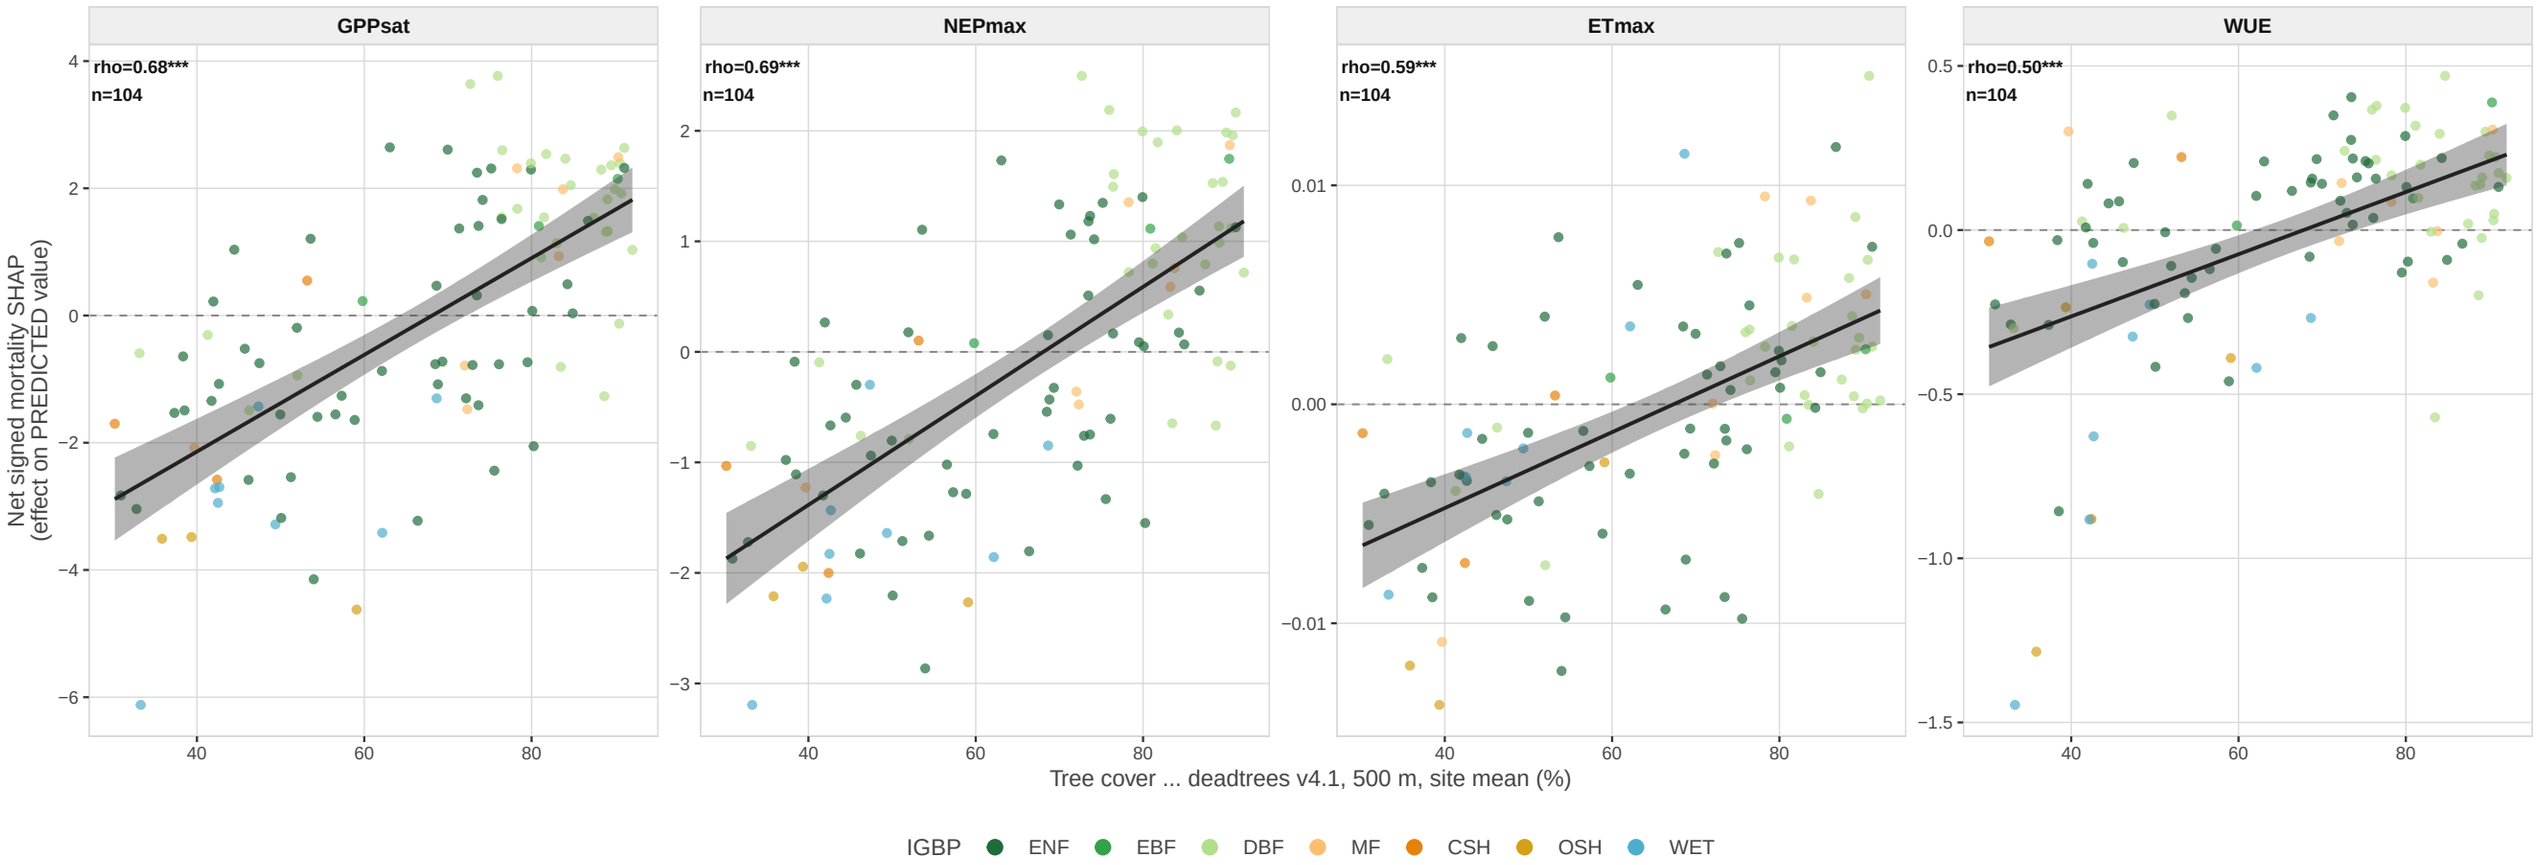

C · Tree cover vs. mortality benefit

Each point = one site | Linear fit with 95% CI | Spearman rho, BH−FDR within this board (*** q<0.001, ** q<0.01, * q<0.05)

D · Tree cover vs. direction of the mortality effect

Each point = one site | Linear fit with 95% CI | below zero = model predicts a LOWER EFP value

E · Total mortality vs. direction of the mortality effect

Each point = one site | Linear fit with 95% CI | below zero = model predicts a LOWER EFP value
