IGBP board ... M4 (C+T+D) | 24m window | LGB | tree cover ...30 % (102 sites, deadtrees v4.1)

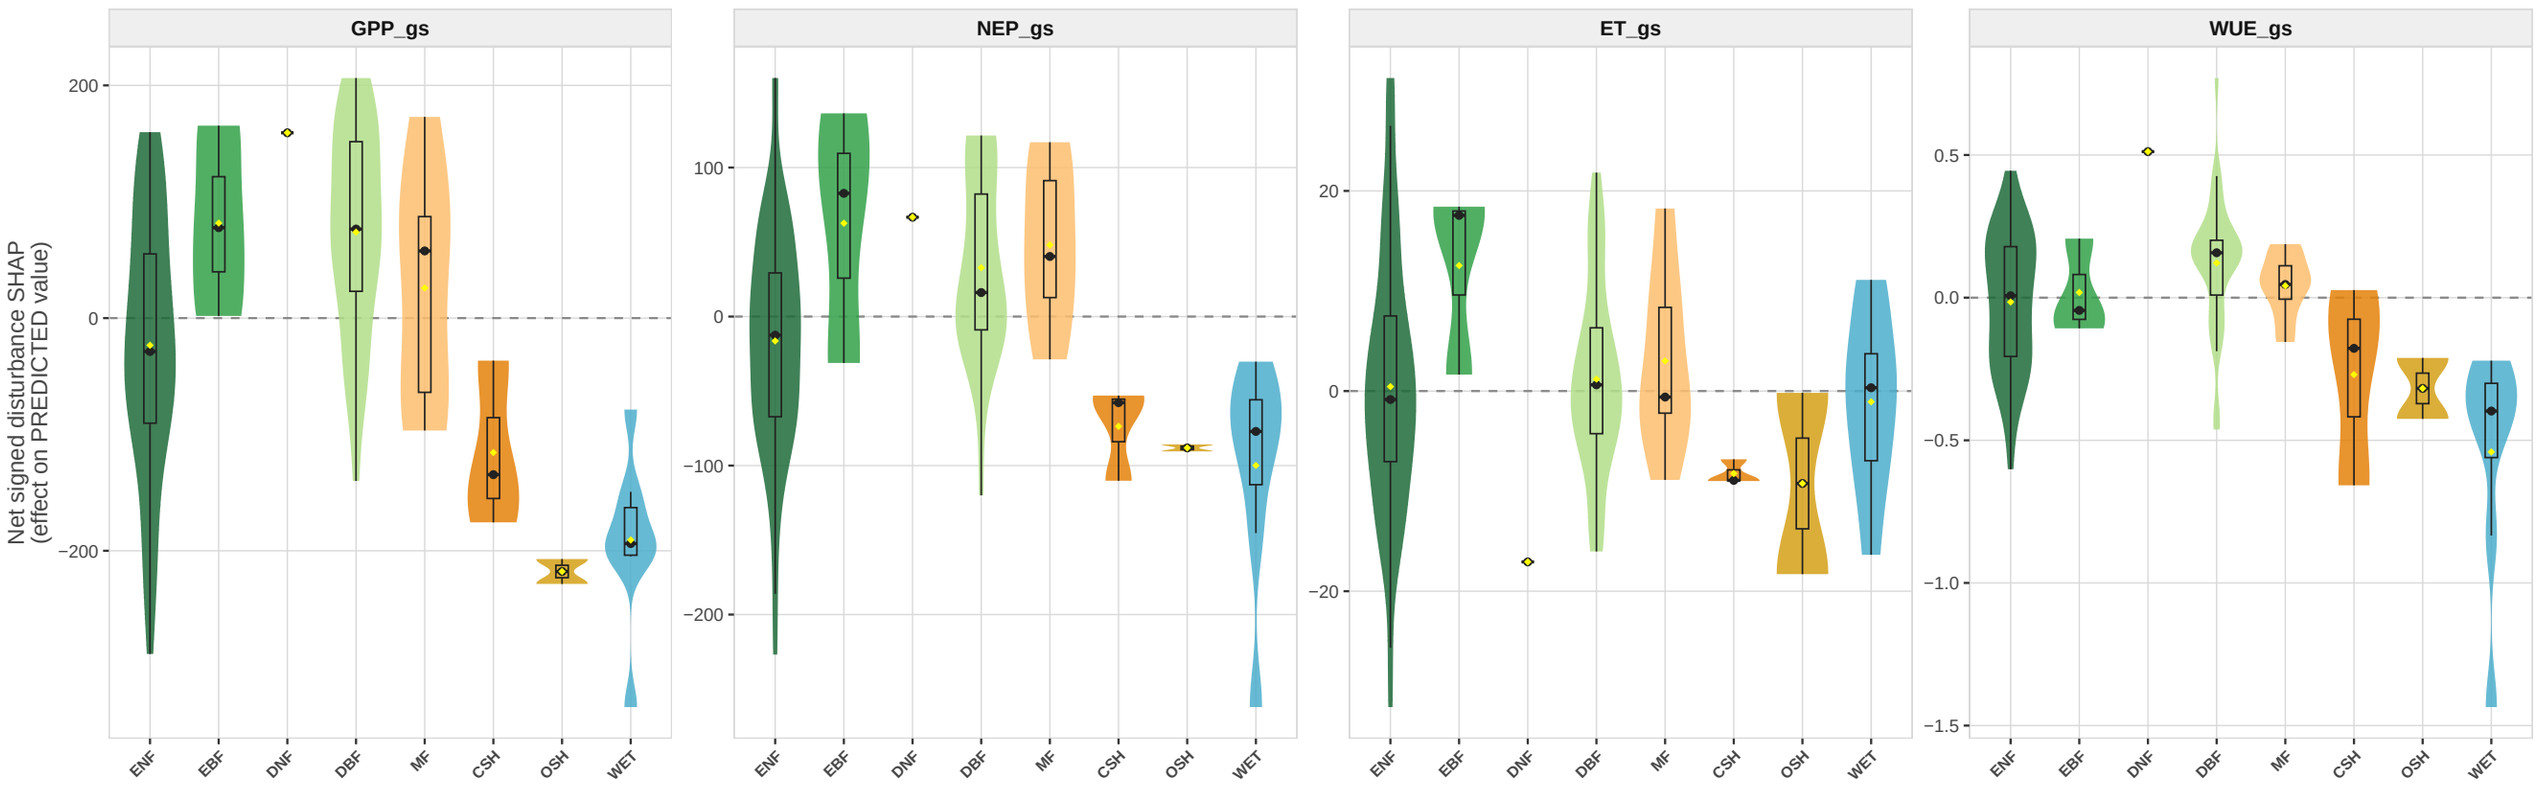

A · ..RMSE by IGBP class

White dot = median | Yellow diamond = mean | negative = D improved

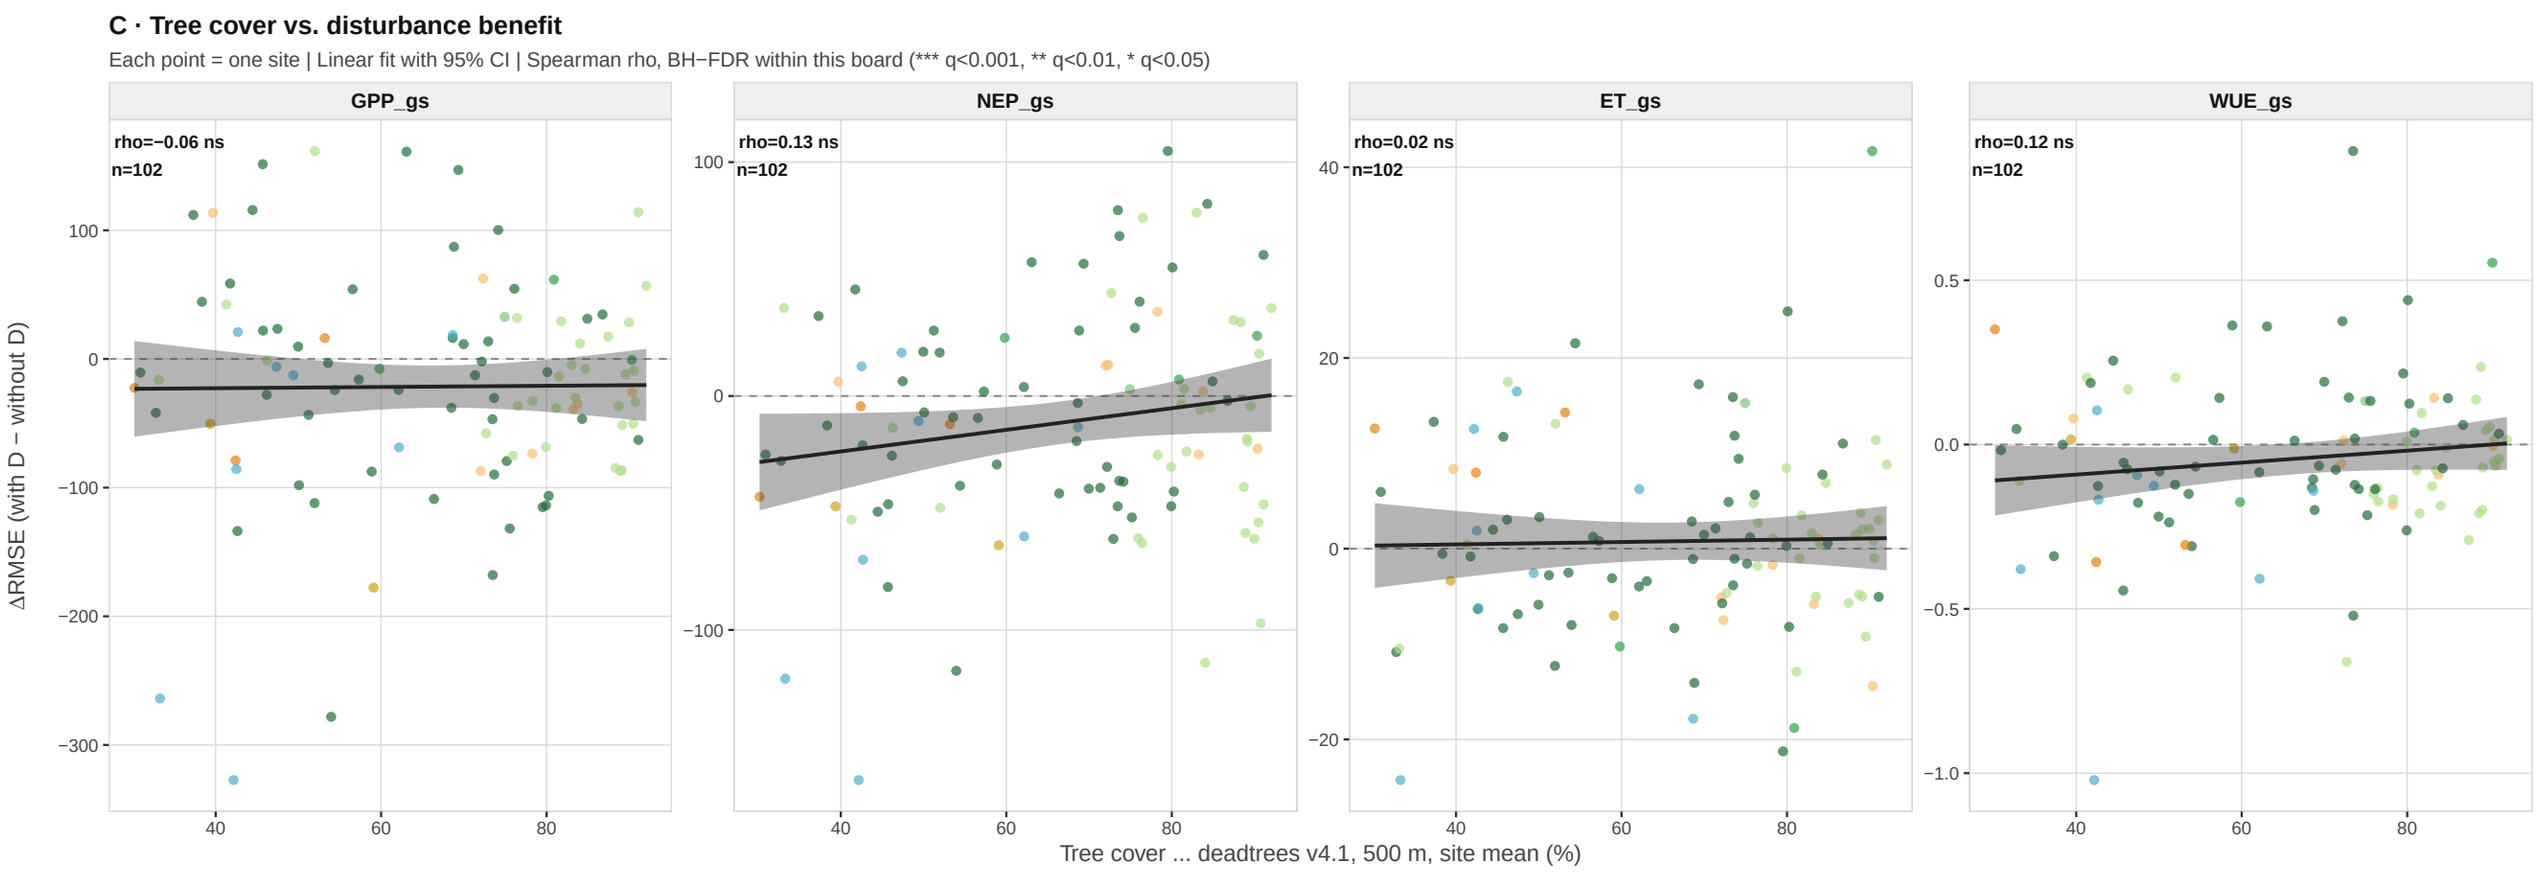

B · Direction of the disturbance effect by IGBP class

Net signed SHAP of the disturbance block | below zero = model predicts a LOWER flux value (not worse accuracy)

C · Tree cover vs. disturbance benefit

Each point = one site | Linear fit with 95% CI | Spearman rho, BH−FDR within this board (*** q<0.001, ** q<0.01, * q<0.05)

D · Tree cover vs. direction of the disturbance effect

Each point = one site | Linear fit with 95% CI | below zero = model predicts a LOWER flux value

E · Relative disturbance vs. direction of the disturbance effect

Each point = one site | Linear fit with 95% CI | below zero = model predicts a LOWER flux value
