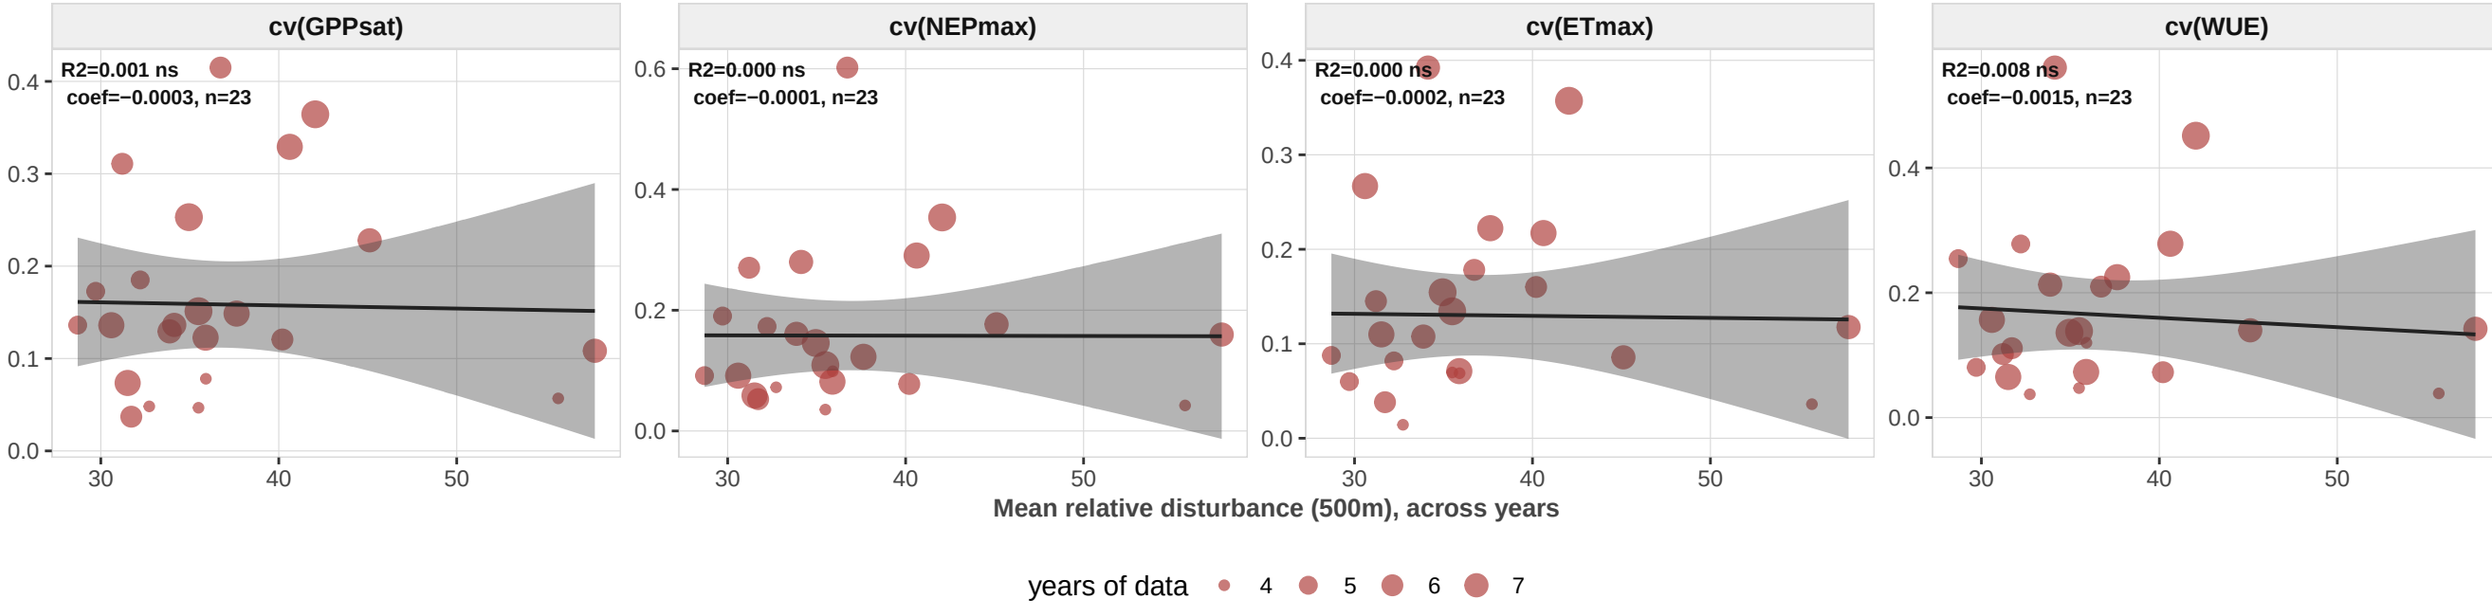
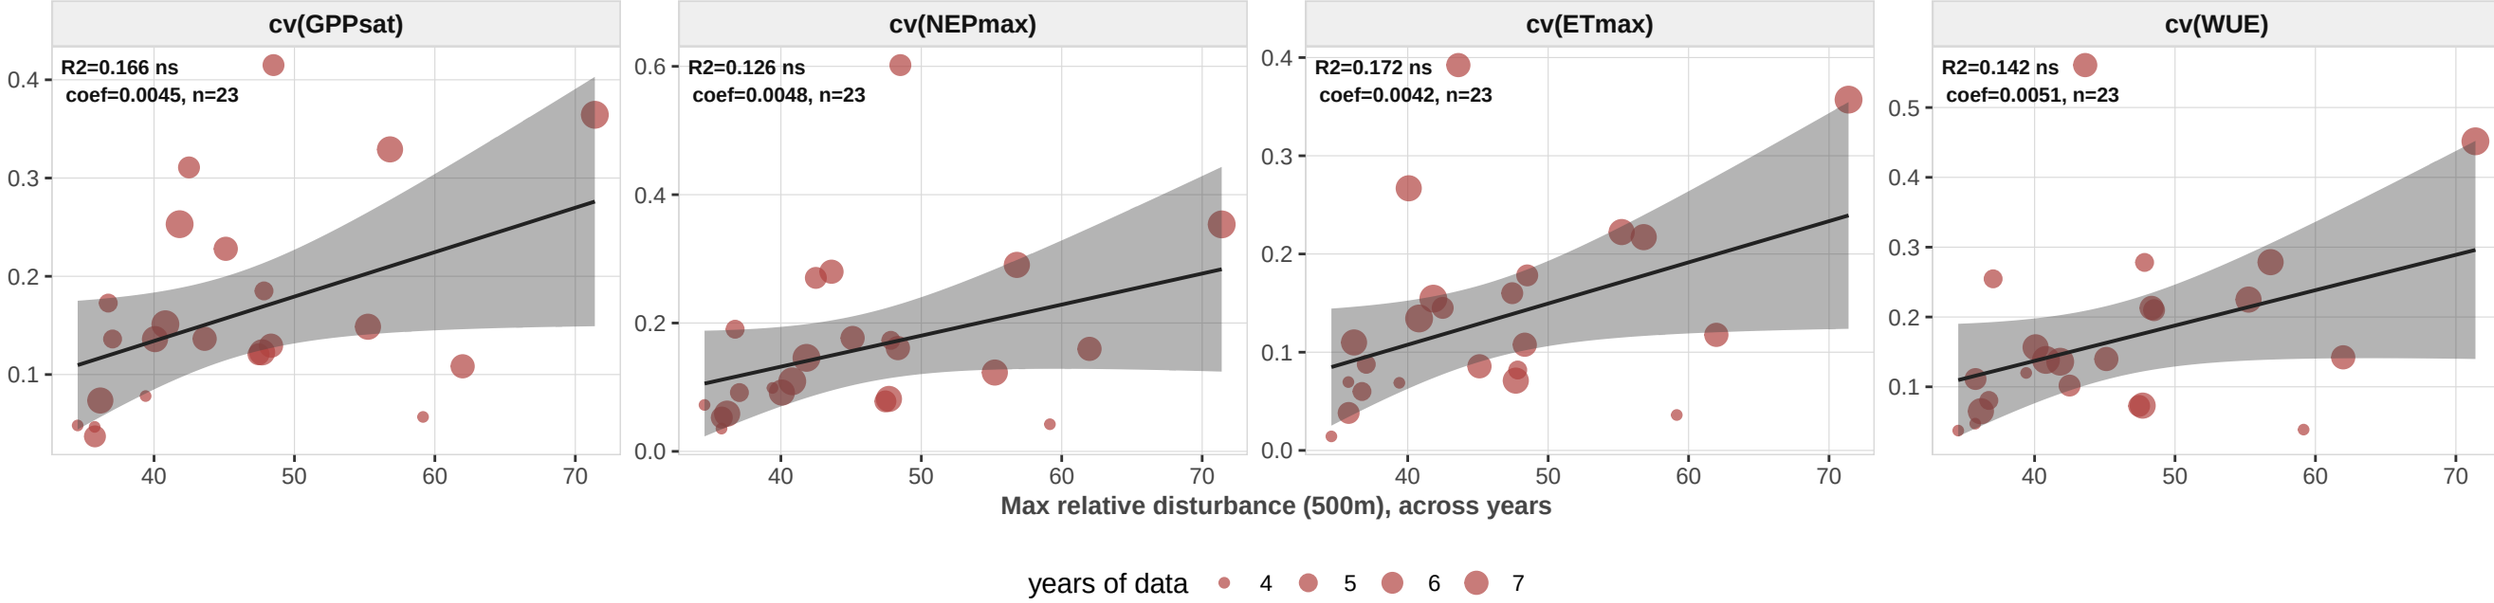
Does mortality explain interannual variability (CV) of EFPs? High−disturbance sites only (Musavi et al. 2017 design)

tc>=30, High−disturbance subset only (23/93 sites, max relative_disturbance_500m > 34.5% NB threshold), >=3 years raw EFP record | weighted lm, weight = 1/sqrt(n_years)
top row: mean relative disturbance across years | bottom row: max relative disturbance across years | point size = years of data





Same design as musavi_cv_vs_mortality.png (full 93−site sample), restricted to the 23 High−disturbance sites.
