Effect of adding mortality predictors on per−site RMSE ... high−mortality sites

HIGH−mortality sites only: 22 of 101 sites (site−maximum relative deadwood, mean of 100−500 m buffers, > 17.5 % = mean + 0.5 SD); models trained on all sites
Tree cover ...30 % (101 sites, 361 site−years) · deadtrees v5 · repeated CV (3×80 %) · C+T vs C+T+M · cyan = without mortality, pink = with mortality
% = median PAIRED change in per−site RMSE (negative = less error) · stars = one−sided paired Wilcoxon, BH−FDR across the figure (*** q<0.001, ** q<0.01, * q<0.05)
%... = share of sites whose RMSE improved · y axis zoomed to the 95th percentile (no data removed)
